

Electromagnetic Waves

Displacement current

- It is the current that exists in the region where the electric field and the electric flux is changing with time.
- The displacement current is given by $I_D = \epsilon_0 \frac{d\Phi_E}{dt}$
 - where, ϵ_0 = absolute permittivity of free space,
 - $\frac{d\Phi_E}{dt}$ = time rate of change of the flux.

Ampere-Maxwell's Law

- According to this law the line integral of the magnetic field (\vec{B}) over a closed path is equal to μ_0 times the sum of the conduction current I and the displacement current (I_D)
- $\oint \vec{B} \cdot d\vec{l} = \mu_0 \left(I + \epsilon_0 \frac{d\Phi_E}{dt} \right)$

Electromagnetic waves

- These are the waves in which the electric and the magnetic field vary sinusoidally at right angle to each other as well as to the direction of propagation.
- The speed of electromagnetic waves in free space is given by

$$c = \frac{1}{\sqrt{\mu_0 \epsilon_0}} = 3 \times 10^8 \text{ ms}^{-1} .$$

- For an electromagnetic wave travelling along positive Z-axis, electric field oscillates along X-axis and is given by $E_x = E_0 \sin (kz - \omega t)$ and magnetic field oscillates along Y-axis and is given by $B_y = B_0 \sin (kz - \omega t)$.

- The relation between the amplitudes of magnetic and electric fields is $B_0 = \frac{E_0}{c}$.

The intensity of electromagnetic wave is given by $\frac{1}{2} \epsilon_0 E_0^2 c$.

- The velocity of light in a material medium is given by

$$v = \frac{1}{\sqrt{\mu \epsilon}}$$

Here,

ϵ = permittivity of material medium

μ = permeability of material medium

- Electromagnetic waves carry energy and momentum and they also exert pressure, called

radiation pressure.

- When the total energy (U) is transferred to a surface in time t , the magnitude of the total momentum delivered to the surface is given by

$$p = \frac{U}{c}, \text{ where } c = \text{speed of light}$$

- Hertz set up an experiment in order to produce and detect electromagnetic waves. In this experiment, a high voltage source causes spark to oscillate and, thus, electromagnetic waves are produced by the oscillating spark.
- Different electromagnetic waves:

| • | Type | Wavelength range |
|----------|---------------|----------------------|
| <i>a</i> | Radio waves | >0.1 m |
| <i>b</i> | Microwave | 0.1 m to 1 mm |
| <i>c</i> | Infra-red | 1 mm to 700 nm |
| <i>d</i> | Visible light | 700 nm to 400 nm |
| <i>e</i> | Ultra-violet | 400 nm to 1 nm |
| <i>f</i> | X-rays | 1 nm to 10^{-3} nm |
| <i>g</i> | Gamma rays | $<10^{-3}$ nm |

- Uses of electromagnetic radiations:

| Electromagnetic radiations | Uses |
|----------------------------|---|
| Infrared | to identify molecular structure of compounds, ion long distance photography, diagnosing tumors, in TV remote and solar energy operated devices. |
| UV | Used as sterilizer, in fluorescent lamps, treatment of diseases skin and bone, in radiography, to study of crystal structure. |
| X-rays | in treatment of cancer and skin diseases, locate fractured bones, in radiography, to study of crystal structure. |
| γ -rays | in treatment of cancer, used as catalyst in manufacturing of some chemicals, to produce photoelectric effect, and in radiography. |
| Microwave | In RADAR, satellite communication and ovens. |
| Radio wave | In communication, TV and Radio broadcasting. |
