

# CBSE Class 12 physics Important Questions Chapter 10 Haloalkanes and Haloarenes

#### **5 Marks Questions**

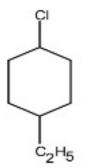

- 1. Write structures of the following compounds:
- (i) 2-Chloro-3-methylpentane
- (ii) 1-Chloro-4-ethylcyclohexane
- (iii) 4-tert. Butyl-3-iodoheptane
- (iv) 1,4-Dibromobut-2-ene
- (v) 1-Bromo-4-sec. butyl-2-methylbenzene

#### Ans. (i)

# 2-Chloro-3-methyl pentane

#### (ii)

# 1-Chloro-4-ethylcyclohexane

(iii)

4- tert-Butyl-3-iodoheptane

(iv)

$$Br - \overset{1}{C}H_2 - \overset{2}{C}H = \overset{3}{C}H - \overset{4}{C}H_2 - Br$$

1, 4-Dibromobut-2-ene

**(v)** 

1-Bromo-4-sec-butyl-2-methylbenzene

# 2. Write structures of different dihalogen derivatives of propane.

**Ans.** There are four different dihalogen derivatives of propane. The structures of these derivatives are shown below.

(i)

1, 1-Dibromopropane

(ii)

2, 2-Dibromopropane

(iii)

1, 2-Dibromopropane

(iv)

$$Br - CH_2 - CH_2 - CH_2 - Br$$

- 1, 3-Dibromopropane
- 3. Among the isomeric alkanes of molecular formula  $C_5H_{12}$  , identify the one that on photochemical chlorination yields
- (i) A single monochloride.
- (ii) Three isomeric monochlorides.
- (iii) Four isomeric monochlorides.
- **Ans. (i)** To have a single monochloride, there should be only one type of H-atom in the isomer of the alkane of the molecular formula  $C_5H_{12}$ . This is because, replacement of any H-atom leads to the formation of the same product. The isomer is neopentane.

#### Neopentane

(ii) To have three isomeric monochlorides, the isomer of the alkane of the molecular formula  $C_5H_{12}$  should contain three different types of H-atoms.

Therefore, the isomer is n-pentane. It can be observed that there are three types of H atoms labelled as a, b and c in n-pentane.

$$C\ddot{H}_{3}-C\ddot{H}_{2}-C\ddot{H}_{2}-C\ddot{H}_{2}-C\ddot{H}_{2}$$
*n*-Pentane

(iii) To have four isomeric monochlorides, the isomer of the alkane of the molecular formula  $C_5H_{12}$ should contain four different types of H-atoms. Therefore, the isomer is 2-methylbutane. It can be observed that there are four types of H-atoms labelled as a, b, c, and d in 2-methylbutane.

### 4. Draw the structures of major monohalo products in each of the following reactions:

(i)

(ii)

(iii)

(iv)

**(v)** 

(vi)

#### Ans. (i)

$$OH$$
 +  $SOCI_2$   $OH$  +  $SO_2 + HC$  Cyclohexanol Chlorocyclohexane

(ii)

$$CH_2CH_3$$
 $Br$ 
 $CH_2CH_3$ 
 $Br_2 \longrightarrow heat or$ 
 $CH_2CH_3$ 
 $CH \longrightarrow CH_3$ 
 $CH \longrightarrow CH_3$ 

4 - Ethylnitrobenzene

4 - (1 - Bromoethyl) nitrobenzene

(iii)

4 - Hydroxymethylphenol

4 - Chloromethylphenol

(iv)

$$CH_3$$
  
+ HI  $I$   
1 - Methylcyclohexene  $I$  - Iodo -  $I$  - methylcyclohexane

**(v)** 

(vi)

$$\begin{array}{c|c} & & & Br \\ \hline & & & & \\ \hline & &$$

- 5. Arrange each set of compounds in order of increasing boiling points.
- (i) Bromomethane, Bromoform, Chloromethane, Dibromomethane.
- (ii) 1-Chloropropane, Isopropyl chloride, 1-Chlorobutane.

#### Ans. (i)

For alkyl halides containing the same alkyl group, the boiling point increases with an increase in the atomic mass of the halogen atom.

Since the atomic mass of Br is greater than that of Cl, the boiling point of bromomethane is higher than that of chloromethane.

Further, for alkyl halides containing the same alkyl group, the boiling point increases with an increase in the number of halides. Therefore, the boiling point of Dibromomethane is

higher than that of chloromethane and bromomethane, but lower than that of bromoform.

Hence, the given set of compounds can be arranged in the order of their increasing boiling points as:

Chloromethane < Bromomethane < Dibromomethane < Bromoform.

(ii)

$$CH_3$$
— $CH$ — $CH_3$   $CI$ — $CH_2$ — $CH_2$ — $CH_3$   $CI$ — $CH_2$ — $CH_2$ — $CH_3$ —

For alkyl halides containing the same halide, the boiling point increases with an increase in the size of the alkyl group. Thus, the boiling point of 1-chlorobutane is higher than that of isopropyl chloride and 1-chloropropane.

Further, the boiling point decreases with an increase in branching in the chain. Thus, the boiling point of isopropyl alcohol is lower than that of 1-chloropropane.

Hence, the given set of compounds can be arranged in the increasing order of their boiling points as:

Isopropyl chloride < 1-Chloropropane < 1-Chlorobutane

6. Which alkyl halide from the following pairs would you expect to react more rapidly by an  $S_{\rm N}2$  mechanism? Explain your answer.

(ii)

$$\begin{array}{cccc} CH_3 \\ CH_3CH_2CHCH_3 & \text{or} & H_3C - C - Br \\ & & & CH_3 \end{array}$$

(iii)

#### Ans. (i)

2-bromobutane is a  $2^{\circ}$  alkylhalide whereas 1-bromobutane is a  $1^{\circ}$  alkyl halide. The approaching of nucleophile is more hindered in 2-bromobutane than in 1-bromobutane. Therefore, 1-bromobutane reacts more rapidly than 2-bromobutane by an  $S_N 2$  mechanism.

#### (ii)

2-Bromobutane is  $2^{\circ}$  alkylhalide whereas 2-bromo-2-methylpropane is  $3^{\circ}$  alkyl halide. Therefore, greater numbers of substituents are present in  $3^{\circ}$  alkyl halide than in  $2^{\circ}$  alkylhalide to hinder the approaching nucleophile. Hence, 2-bromobutane reacts more rapidly than 2-bromo-2-methylpropane by an  $S_N 2$  mechanism.

#### (iii)

Both the alkyl halides are primary. However, the substituent  $-CH_3$  is at a greater distance to the carbon atom linked to Br in 1-bromo-3-methylbutane than in 1-bromo-2-methylbutane. Therefore, the approaching nucleophile is less hindered in case of the former than in case of the latter. Hence, the former reacts faster than the latter by  $S_N 2$  mechanism.

# 7. In the following pairs of halogen compounds, which compound undergoes faster $S_{\rm N}1$ reaction?

(i) Cl Cl

 $\sim$  and  $\sim$  CI

Ans. (i)

(ii)

2 - Chloro - 2 - methylpropane (3°)

(I)

Cl

Cl

3 - chloropentane (2°)

 $S_N1$  reaction proceeds via the formation of carbocation. The alkyl halide (I) is  $3^\circ$  while (II) is  $2^\circ$ . Therefore, (I) forms  $3^\circ$  carbocation while (II) forms  $2^\circ$  carbocation. Greater the stability of the carbocation, faster is the rate of  $S_N1$  reaction. Since  $3^\circ$  carbocation is more stable than  $2^\circ$  carbocation. (I), i.e. 2-chloro-2-methylpropane, undergoes faster  $S_N1$  reaction than (II) i.e., 3-chloropentane.

(ii)

The alkyl halide (I) is  $2^{\circ}$  while (II) is  $1^{\circ}$ .  $2^{\circ}$  carbocation is more stable than  $1^{\circ}$  carbocation. Therefore, (I), 2-chloroheptane, undergoes faster  $S_N 1$  reaction than (II), 1-chlorohexane.

# 8. Identify A, B, C, D, E, R and $R^1$ in the following:

Ans.

Since D of  $\,D_2O\,$  gets attached to the carbon atom to which MgBr is attached, C is

Therefore, the compound R - Br is

CH<sub>3</sub>CHCH<sub>3</sub>

Br

2 - Bromopropane

CH<sub>3</sub>CHCH<sub>3</sub> + Mg 
$$\xrightarrow{\text{dry ether}}$$
 CH<sub>3</sub>CHCH<sub>3</sub>  $\xrightarrow{\text{D}_2\text{O}}$  CH<sub>3</sub>CHCH<sub>3</sub>

Br

MgBr

(C)

When an alkyl halide is treated with Na in the presence of ether, a hydrocarbon containing double the number of carbon atoms as present in the original halide is obtained as product. This is known as Wurtz reaction. Therefore, the halide,  $\mathbb{R}^1 - X$ , is

tert - Butylhalide

Therefore, compound D is

tert - Bulytmagnesiumbromide

And, compound E is

2 - Methylpropane

CH<sub>3</sub> CH<sub>3</sub> CH<sub>3</sub> CH<sub>3</sub> CH<sub>3</sub> 
$$CH_3$$
 CH<sub>3</sub>  $CH_3$  CH<sub>3</sub>  $CH_3$   $CH_3$ 

- 9. Name the following halides according to IUPAC system and classify them as alkyl, allyl, benzyl (primary, secondary, tertiary), vinyl or aryl halides:
- (i)  $(CH_3)$ ,  $CHCH(Cl)CH_3$
- (ii)  $CH_3CH_2CH(CH_3)CH(C_2H_5)Cl$
- (iii)  $CH_3CH_2C(CH_3)$ ,  $CH_2I$
- (iv)  $(CH_3)_3 CCH_2CH(Br)C_6H_5$
- (v)  $CH_3CH(CH_3)CH(Br)CH_3$
- (vi)  $CH_3C(C_2H_5)_2CH_2Br$
- (vii)  $CH_3C(Cl)(C_2H_5)CH_2CH_3$

(viii) 
$$CH_3CH = C(Cl)CH_2CH(CH_3)_2$$

(ix) 
$$CH_3CH = CHC(Br)(CH_3)_2$$

(x) 
$$p - ClC_6H_4CH_2CH(CH_3)_2$$

(xi) 
$$m - ClCH_2C_6H_4CH_2C(CH_3)_3$$

(xii) 
$$o - Br - C_6H_4CH(CH_3)CH_2CH_3$$

#### Ans. (i)

2-Chloro-3-methylbutane

(Secondary alkyl halide)

(ii)

$$^{\text{CH}_3}_{^{6}}$$
  $^{\text{CI}}_{^{5}}$   $^{4}$   $^{1}$   $^{3}$   $^{2}$   $^{1}$   $^{1}$   $^{\text{CH}_3}$   $^{-\text{CH}_2}$   $^{-\text{CH}_2}$   $^{-\text{CH}_3}$ 

3-Chloro-4-methyhexane

(Secondary alkyl halide)

(iii)

1-Iodo-2, 2 -dimethylbutane

(Primary alkyl halide)

(iv)

$$\begin{array}{c|c} CH_3 & Br \\ CH_3 & C - CH_2 - CH - CH \end{array}$$

1-Bromo-3, 3-dimethyl-1-phenylbutane

(Secondary benzyl halide)

**(v)** 

2-Bromo-3-methylbutane

(Secondary alkyl halide)

(vi)

1-Bromo-2-ethyl-2-methylbutane

(Primary alkyl halide)

(vii)

3-Chloro-3-methylpentane

(Tertiary alkyl halide)

(viii)

$$_{1}^{CH_{3}}$$
  $_{CH_{3}}^{CH_{2}}$   $_{CH_{2}}^{CH_{3}}$   $_{CH_{3}}^{CH_{3}}$   $_{CH_{3}}^{CH_{3}}$   $_{CH_{3}}^{CH_{3}}$ 

3-Chloro-5-methylhex-2-ene

(Vinyl halide)

(ix)

$$^{1}\text{CH}_{3}$$
— $^{2}\text{CH}$  =  $^{3}\text{CH}$  —  $^{4}\text{C}$  —  $^{5}\text{CH}_{3}$  —  $^{5}\text{CH}_{3}$ 

4-Bromo-4-methylpent-2-ene

(Allyl halide)

**(**x**)** 

# 1-Chloro-4-(2-methylpropyl) benzene

(Aryl halide)

(xi)

1-Chloromethyl-3-(2, 2-dimethylpropyl) benzene

(Primary benzyl halide)

(xii)

1-Bromo-2-(1-methylpropyl) benzene

(Aryl halide)

- 10. Give the IUPAC names of the following compounds:
- (i)  $CH_3CH(Cl)CH(Br)CH_3$
- (ii)  $CHF_2CBrClF$
- (iii)  $ClCH_2C = CCH_2Br$
- (iv)  $\left(CCl_3\right)_3CCl$

(v) 
$$CH_3C(p-ClC_6H_4)_2CH(Br)CH_3$$

(vi) 
$$\left(CH_3\right)_3 CCH = CClC_6H_4I - p$$

Ans. (i)

2-Bromo-3-chlorobutane

(ii)

1-Bromo-1-chloro-1, 2, 2-trifluoroethane

(iii)

$$CI - {}^{4}CH_{2} - {}^{3}C \equiv {}^{2}C - {}^{1}CH_{2} - Br$$

1-Bromo-4-chlorobut-2-yne

(iv)

2-(Trichloromethyl)-1,1,1,2,3,3,3-heptachloropropane

**(v)** 

2-Bromo-3, 3-bis(4-chlorophenyl) butane

(vi)

$$CI - CI = CH_3$$
 $CH_3$ 
 $CH_3$ 

1-chloro-1-(4-iodophenyl)-3, 3-dimethylbut-1-ene

- 11. Write the structures of the following organic halogen compounds.
- (i) 2-Chloro-3-methylpentane
- (ii) p-Bromochlorobenzene
- (iii) 1-Chloro-4-ethylcyclohexane
- (iv) 2-(2-Chlorophenyl)-1-iodooctane
- (v) Perfluorobenzene
- (vi) 4-tert-Butyl-3-iodoheptane
- (vii) 1-Bromo-4-sec-butyl-2-methylbenzene

# (viii) 1,4-Dibromobut-2-ene

#### Ans. (i)

#### 2-Chloro-3-methylpentane

#### (ii)

# p-Bromochlorobenzene

#### (iii)

$$\begin{array}{c}
C1 \\
6 \\
\downarrow^{1} \\
C_{2}H_{5}
\end{array}$$

# 1-Chloro-4-ethylcyclohexane

#### (iv)

$$I - \overset{1}{C}H_{2} - \overset{2}{C}H - \overset{3}{C}H_{2} - \overset{4}{C}H_{2} - \overset{5}{C}H_{2} - \overset{6}{C}H_{2} - \overset{7}{C}H_{2} - \overset{8}{C}H_{3}$$

# 2-(2-Chlorophenyl)-1-iodooctane

**(v)** 

$$F$$
 $F$ 
 $F$ 
 $F$ 

Perfluorobenzene

(vi)

4-Tert-Butyl-3-iodoheptane

(vii)

 $1\hbox{-}Bromo\hbox{-}4\hbox{-}sec\hbox{-}butyl\hbox{-}2\hbox{-}methylbenzene$ 

(viii)

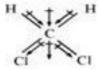

$$Br - \overset{1}{C}H_2 - \overset{2}{C}H = \overset{3}{C}H - \overset{4}{C}H_2 - Br$$

1,4-Dibromobut-2-ene

- 12. Which one of the following has the highest dipole moment?
- (i)  $CH_2Cl_2$  (ii)  $CHCl_3$  (iii)  $CCl_4$

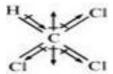

#### Ans. (i)

Dichlormethane (  $CH_2Cl_2$  )

$$\mu = 1.60D$$

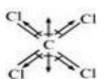

(ii)

Chloroform ( $CHCl_3$ )

$$\mu = 1.08D$$

#### (iii)

Carbon tetrachloride ( $CCl_4$ )

$$\mu = 0D$$

 ${\it CCl}_4$  is a symmetrical molecule. Therefore, the dipole moments of all four C-Cl bonds cancel each other. Hence, its resultant dipole moment is zero.

As shown in the above figure, in  $CHCl_3$ , the resultant of dipole moments of two C-Cl bonds is opposed by the resultant of dipole moments of one C-H bond and one C-Cl bond. Since the resultant of one C-H bond and one C-Cl bond dipole moments is smaller than two C-Cl bonds, the opposition is to a small extent. As a result,  $CHCl_3$  has a small dipole moment of 1.08 D.

On the other hand, in case of  $CH_2Cl_2$ , the resultant of the dipole moments of two C-Cl bonds is strengthened by the resultant of the dipole moments of two C-H bonds. As a result,

 $CH_2Cl_2$  has a higher dipole moment of 1.60 D than  $\ CHCl_3$   $l_3$  i.e.,  $\ CH_2Cl_2$  has the highest dipole moment.

Hence, the given compounds can be arranged in the increasing order of their dipole moments as:

$$CCl_4 \leq CHCl_3 \leq CH_2Cl_2$$

# 13. Write the isomers of the compound having formula $C_4H_{\mathfrak{g}}Br$ .

**Ans.** There are four isomers of the compound having the formula  $C_4H_9Br$ . These isomers are given below.

(a)

$$^{4}_{\text{CH}_{3}}$$
 —  $^{3}_{\text{CH}_{2}}$  —  $^{2}_{\text{CH}_{2}}$  —  $^{1}_{\text{CH}_{2}}$  — Br

1-Bromobutane

**(b)** 

2-Bromobutane

(c)

1-Bromo-2-methylpropane

(d)

2-Bromo-2-methylpropane

- 14. Predict all the alkenes that would be formed by dehydrohalogenation of the following halides with sodium ethoxide in ethanol and identify the major alkene:
- (i) 1-Bromo-1-methylcyclohexane
- (ii) 2-Chloro-2-methylbutane
- (iii) 2,2,3-Trimethyl-3-bromopentane.

#### Ans. (i)

$$H$$
 $Br$ 
 $CH_3$ 
 $H$ 
 $B$ 
 $B$ 
 $B$ 
 $H$ 

In the given compound, there are two types of -hydrogen atoms are present. Thus, dehydrohalogenation of this compound gives only one alkenes.

(ii)

$$\begin{array}{c}
CI \\
CH_3 \longrightarrow C \longrightarrow CH_2 \longrightarrow CH_3 \\
CH_3 \longrightarrow CH_3
\end{array}$$

In the given compound, there are two different sets of equivalent -hydrogen atoms labelled as *a* and *b*. Thus, dehydrohalogenation of the compound yields two alkenes.

CH<sub>3</sub>—CH<sub>2</sub>—CH<sub>3</sub> 
$$C_2H_5ONa/C_2H_5OH$$
 CH<sub>3</sub>—CH<sub>3</sub>—CH—CH<sub>3</sub>

CH<sub>3</sub>

$$CH_3$$

$$CH_3$$

$$CH_3$$

$$CH_3$$

$$CH_2 = C$$

$$CH_2 - CH_2 - CH_3$$

$$CH_3$$

Saytzeff's rule implies that in dehydrohalogenation reactions, the alkene having a greater number of alkyl groups attached to a doubly bonded carbon atoms is preferably produced.

Therefore, alkene (I) i.e., 2-methylbut-2-ene is the major product in this reaction.

#### (iii)

#### 2,2,3-Trimethyl-3-bromopentane

In the given compound, there are two different sets of equivalent -hydrogen atoms labelled as *a* and *b*. Thus, dehydrohalogenation of the compound yields two alkenes.

According to Saytzeff's rule, in dehydrohalogenation reactions, the alkene having a greater number of alkyl groups attached to the doubly bonded carbon atom is preferably formed.

Hence, alkene (I) i.e., 3,4,4-trimethylpent-2-ene is the major product in this reaction.

- 15. How will you bring about the following conversions?
- (i) Ethanol to but-1-yne
- (ii) Ethane to bromoethene
- (iii) Propene to 1-nitropropane
- (iv) Toluene to benzyl alcohol
- (v) Propene to propyne
- (vi) Ethanol to ethyl fluoride
- (vii) Bromomethane to propanone
- (viii) But-1-ene to but-2-ene
- (ix) 1-Chlorobutane to n-octane
- (x) Benzene to biphenyl.

#### Ans. (i)

$$CH_{3}CH_{2}OH \xrightarrow{SOCI_{2}, Pyridine} CH_{3}CH_{2}C1 + SO_{2} + HC1$$

$$Ethanol Chloroethane$$

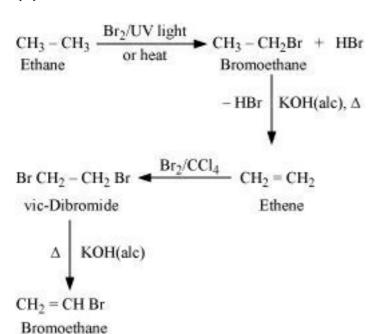

$$HC \equiv CH + NaNH_{2} \xrightarrow{Liq. NH_{3}} HC \equiv \stackrel{-}{C} \stackrel{+}{N} a$$

$$Ethyne Sodium acetylide$$

$$CH_{3}CH_{2} - CI + HC \equiv \stackrel{-}{C} \stackrel{+}{N} a \longrightarrow CH_{3}CH_{2}C \equiv CH + NaCI$$

$$Chloroethane But - 1 - yne$$

#### (ii)

#### (iii)

(iv)

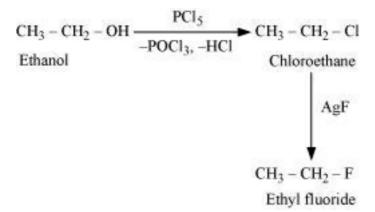

**(v)** 

$$CH_3 - CH = CH_2 \xrightarrow{Br_2/CCl_4} CH_3 - CH - CH_2 \xrightarrow{NaNH_2} CH_3 - C = CH$$
Propene
$$CH_3 - CH = CH_2 \xrightarrow{Propyne} CH_3 - C = CH_3$$
Propyne

1, 2-Dibromopropane

#### (vi)

#### (vii)

$$CH_{3}-Br \xrightarrow{KCN \text{ (alc)}} CH_{3}-CN \xrightarrow{CH_{3}-MgBr} CH_{3}-C=NMgBr$$
Bromethane
$$CH_{3} - C = NMgBr$$

$$CH_{3} - C = O$$

(viii)

CH<sub>3</sub>CH<sub>2</sub>CH = CH<sub>2</sub> 
$$\xrightarrow{\text{HBr}}$$
 CH<sub>3</sub>CH<sub>2</sub>CHCH<sub>3</sub>

But-l-ene  $\xrightarrow{\text{(Markovnikov)}}$  2-Bromobutane

- HBr  $\downarrow$  KOH (alc),  $\triangle$  CH<sub>3</sub>CH = CHCH<sub>3</sub>

2 - Bromobutane

(ix)

$$2CH_{3}CH_{2}CH_{2}CH_{2}-CI+2Na \xrightarrow{dry \, ether \ -2NaCI} CH_{3}CH_{2}CH_{2}CH_{2}CH_{2}CH_{2}CH_{2}CH_{2}CH_{3}$$

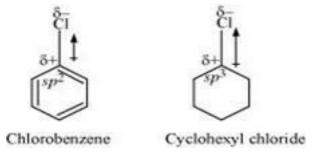

$$1-Chlordrutane n-Octane$$

(x)

# 16. Explain why

- (i) the dipole moment of chlorobenzene is lower than that of cyclohexyl chloride?
- (ii) alkyl halides, though polar, are immiscible with water?
- (iii) Grignard reagents should be prepared under anhydrous conditions?

#### Ans. (i)

In chlorobenzene, the Cl-atom is linked to a  $\mathfrak{sp}^2$  hybridized carbon atom. In cyclohexyl

chloride, the Cl-atom is linked to a  $\mathfrak{sp}^3$  hybridized carbon atom. Now,  $\mathfrak{sp}^2$  hybridized carbon has more s-character than  $\mathfrak{sp}^3$  hybridized carbon atom. Therefore, the former is more electronegative than the latter. Therefore, the density of electrons of C - Cl bond near the Cl-atom is less in chlorobenzene than in cydohexyl chloride.

Moreover, the - R effect of the benzene ring of chlorobenzene decreases the electron density of the C - Cl bond near the Cl-atom. As a result, the polarity of the C - Cl bond in chlorobenzene decreases. Hence, the dipole moment of chlorobenzene is lower than that of cyclohexyl chloride.

- (ii) To be miscible with water, the solute-water force of attraction must be stronger than the solute-solute and water-water forces of attraction. Alkyl halides are polar molecules and so held together by dipole-dipole interactions. Similarly, strong H-bonds exist between the water molecules. The new force of attraction between the alkyl halides and water molecules is weaker than the alkyl halide-alkyl halide and water-water forces of attraction. Hence, alkyl halides (though polar) are immiscible with water.
- (iii) Grignard reagents are very reactive. In the presence of moisture, they react to give alkanes.

$$\stackrel{\delta^-}{R} \stackrel{\delta^+}{M} \stackrel{\delta^-}{g} \stackrel{X}{X} + H_2O \longrightarrow R-H + Mg(OH)X$$
Grigrard Alkane
reagent

Therefore, Grignard reagents should be prepared under anhydrous conditions.

# 17. Give the uses of freon 12, DDT, carbon tetrachloride and iodoform.

#### Ans. Uses of Freon - 12

Freon-12 (dichlorodifluoromethane,  $CF_2Cl_2$ ) is commonly known as CFC. It is used as a refrigerant in refrigerators and air conditioners. It is also used in aerosol spray propellants such as body sprays, hair sprays, etc. However, it damages the ozone layer. Hence, its manufacture was banned in the United States and many other countries in 1994.

#### **Uses of DDT**

DDT (*p*, *p*-dichlorodiphenyltrichloroethane) is one of the best known insecticides. It is very effective against mosquitoes and lice. But due its harmful effects, it was banned in the United States in 1973.

# Uses of carbontetrachloride $(CCl_4)$

- (i) It is used for manufacturing refrigerants and propellants for aerosol cans.
- (ii) It is used as feedstock in the synthesis of chlorofluorocarbons and other chemicals.
- (iii) It is used as a solvent in the manufacture of pharmaceutical products.
- **(iv)** Until the mid 1960's, carbon tetrachloride was widely used as a cleaning fluid, a degreasing agent in industries, a spot reamer in homes, and a fire extinguisher.

# Uses of iodoform (CHI<sub>3</sub>)

Iodoform was used earlier as an antiseptic, but now it has been replaced by other formulations-containing iodine-due to its objectionable smell. The antiseptic property of iodoform is only due to the liberation of free iodine when it comes in contact with the skin.

#### 18. Write the structure of the major organic product in each of the following reactions:

(i) 
$$CH_3CH_2CH_2Cl + NaI \xrightarrow{acetone} heat$$

(ii) 
$$(CH_3)_3 CBr + KOH \xrightarrow{\text{ethanol}}$$

(iv) 
$$CH_3CH_2Br + KCN \xrightarrow{aq.ethanol}$$

(v) 
$$C_6H_5ONa + C_7H_5Cl \longrightarrow$$

(vi) 
$$CH_3CH_2CH_2OH + SOCl_2 \longrightarrow$$

(vii) 
$$CH_3CH_2CH = CH_2 + HBr \xrightarrow{Peroxide} \rightarrow$$

(viii) 
$$CH_3CH = C(CH_3)$$
, +  $HBr \longrightarrow$ 

Ans.

(ii)

$$(CH_3)_3 CBr + KOH \xrightarrow{\text{ethanol}} CH_3 - C = CH_2 + KBr + H_2O$$
2-Bromo-2-methylpropane (Dehydrohalogenation)  $CH_3$ 

2-Methylpropene

(iii) 
$$CH_3CH(Br)CH_2CH_3 + NaOH \xrightarrow{water} CH_3CH(OH)CH_2CH_3 + NaBr$$
  
2-Bromobutane Butan - 2 - ol

(iv) 
$$CH_3CH_2Br + KCN \xrightarrow{\text{aq. ethanol} \atop \text{Nucleophilic} \atop \text{substitution}} CH_3CH_2CN + KBr$$

Bromobutane Cyanoethane

(v) 
$$C_6H_5ONa + C_2H_5CI \xrightarrow{\text{(Williamson })} C_6H_5-O-C_2H_5 + NaCI$$
  
Sodium phenoxide Chloroethane Phenetole

(vii) 
$$CH_3CH_2CH = CH_2 + HBr \xrightarrow{Peroxide} CH_3CH_2CH_2CH_2 - Br$$

$$But - 1 - ene I - Bromobutane$$

(viii)

$$CH_{3}CH = C(CH_{3})_{2} + HBr \xrightarrow{\qquad \qquad } CH_{3} - CH_{2} - C - CH_{3}$$

$$2-Methylbut-2-ene \qquad addition) \qquad CH_{3}$$

$$2-Bromo-2-methylbutane$$

- 19. Arrange the compounds of each set in order of reactivity towards  $S_N^2$  displacement:
- (i) 2-Bromo-2-methylbutane, 1-Bromopentane, 2-Bromopentane
- (ii) 1-Bromo-3-methylbutane, 2-Bromo-2-methylbutane, 3-Bromo-2- methylbutane
- (iii) 1-Bromobutane, 1-Bromo-2,2-dimethylpropane, 1-Bromo-2-methylbutane, 1-Bromo-3-methylbutane.

#### Ans. (i)

An  $S_N^2$  reaction involves the approaching of the nucleophile to the carbon atom to which the leaving group is attached. When the nucleophile is sterically hindered, then the reactivity towards  $S_N^2$  displacement decreases. Due to the presence of substituents, hindrance to the approaching nucleophile increases in the following order.

1-Bromopentane < 2-bromopentane < 2-Bromo-2-methylbutane

Hence, the increasing order of reactivity towards  $S_N^{-2}$  displacement is:

2-Bromo-2-methylbutane < 2-Bromopentane < 1-Bromopentane

(ii)

Since steric hindrance in alkyl halides increases in the order of  $1^{\circ} < 2^{\circ} < 3^{\circ}$ , the increasing order of reactivity towards  $S_N^2$  displacement is

Hence, the given set of compounds can be arranged in the increasing order of their reactivity towards  $S_N^2$  displacement as:

2-Bromo-2-methylbutane < 2-Bromo-3-methylbutane < 1-Bromo-3-methylbutane

[2-Bromo-3-methylbutane is incorrectly given in NCERT]

(iii)

$$CH_{3} - CH_{2} - CH_{2} - CH_{2} - Br$$

$$I\text{-Bromobutane}$$

$$CH_{3} - CH_{2} - CH_{2} - CH_{2} - Br$$

$$CH_{3} - CH_{3} - CH_{2} - CH_{2} - Br$$

$$CH_{3} - CH_{2} - CH_{2} - Br$$

$$CH_{3} - C - CH_{2} - CH_$$

The steric hindrance to the nucleophile in the  $S_N^2$  mechanism increases with a decrease in the distance of the substituents from the atom containing the leaving group. Further, the steric hindrance increases with an increase in the number of substituents. Therefore, the increasing order of steric hindrances in the given compounds is as below:

1-Bromobutane < 1-Bromo-2-methylbutane < 1-Bromo-2-methylbutane

< 1-Bromo-2, 2-dimethylpropane

Hence, the increasing order of reactivity of the given compounds towards  $S_N^2$  displacement is:

1-Bromo-2, 2-dimethylpropane < 1-Bromo-2-methylbutane < 1-Bromo-3- methylbutane < 1-Bromobutane

- 20. How the following conversions can be carried out?
- (i) Propene to propan-1-ol
- (ii) Ethanol to but-1-yne
- (iii) 1-Bromopropane to 2-bromopropane
- (iv) Toluene to benzyl alcohol
- (v) Benzene to 4-bromonitrobenzene
- (vi) Benzyl alcohol to 2-phenylethanoic acid
- (vii) Ethanol to propanenitrile
- (viii) Aniline to chlorobenzene
- (ix) 2-Chlorobutane to 3, 4-dimethylhexane
- (x) 2-Methyl-1-propene to 2-chloro-2-methylpropane
- (xi) Ethyl chloride to propanoic acid
- (xii) But-1-ene to n-butyliodide
- (xiii) 2-Chloropropane to 1-propanol
- (xiv) Isopropyl alcohol to iodoform
- (xv) Chlorobenzene to *p*-nitrophenol
- (xvi) 2-Bromopropane to 1-bromopropane
- (xvii) Chloroethane to butane

#### (xviii) Benzene to diphenyl

### (xix) tert-Butyl bromide to isobutyl bromide

#### (xx) Aniline to phenylisocyanide

#### Ans. (i)

Propene (Ani - Markovnikov addition (Nucleophilic substitution) Aq. KOH / 
$$\Delta$$

$$CH_3 - CH_2 - CH_2 - Br$$

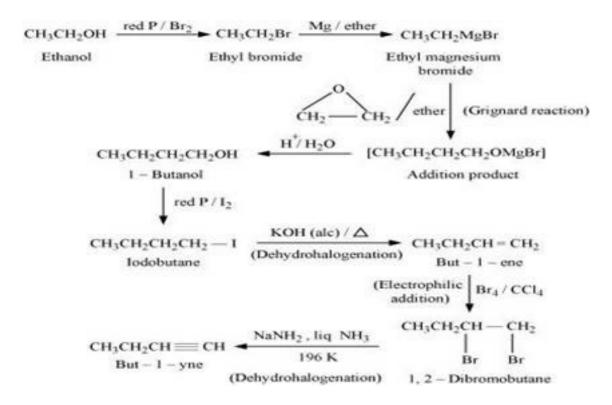

$$1 - Bromopropane$$

# 21. The treatment of alkyl chlorides with aqueous KOH leads to the formation of alcohols but in the presence of alcoholic KOH, alkenes are major products. Explain.

**Ans.** In an aqueous solution, KOH almost completely ionizes to give OH ions. OH almost completely ionizes to give OH ions. OH almost completely ionizes to give OH ions. OH ion is a strong nucleophile, which leads the alkyl chloride to undergo a substitution reaction to form alcohol.

$$R - Cl + KOH_{(\alpha q)} \longrightarrow R - OH + KCl$$
  
Alkyl Alcohol  
chloride

On the other hand, an alcoholic solution of KOH contains alkoxide  $(RO^-)$  ion, which is a strong base. Thus, it can abstract a hydrogen from the  $\beta$ -carbon of the alkyl chloride and form an alkene by eliminating a molecule of HCl.

$$R - CH_2 - CH_2 - CI + KOH(alc) \longrightarrow R - CH = CH_2 + KCI + H_2O$$
  
Alkyl chloride Alkene

 $OH^-$  ion is a much weaker base than RO  $^-$ ion. Also,  $OH^-$  ion is highly solvated in an aqueous solution and as a result, the basic character of  $OH^-$  ion decreases. Therefore, it cannot abstract a hydrogen from the  $\beta$ -carbon.

Concept Insight:  $OH^-$  is a strong nucleophile but weaker base than  $RO^-$ 

22. Primary alkyl halide  $C_4H_{\mathfrak{g}}Br$  (a) reacted with alcoholic KOH to give compound (b).Compound (b) is reacted with HBr to give (c) which is an isomer of (a). When (a) is reacted with sodium metal it gives compound (d),  $C_{\mathbb{g}}H_{1\mathbb{g}}$  which is different from the

# compound formed when n-butyl bromide is reacted with sodium. Give the structural formula of (a) and write the equations for all the reactions.

**Ans.** There are two primary alkyl halides having the formula,  $C_4H_9Br$ . They are n - bulyl bromide and isobutyl bromide.

$$CH_3 - CH_2 - CH_2 - CH_2 - Br$$
  $CH_3 - CH - CH_2 - Br$   $CH_3$   $CH_3$   $CH_3$   $CH_3$   $CH_3$   $CH_3$ 

Therefore, compound (a) is either *n*-butyl bromide or isobutyl bromide.

Now, compound (a) reacts with Na metal to give compound (b) of molecular formula,  $C_{\mathbb{S}}H_{1\mathbb{S}}$ , which is different from the compound formed when n-butyl bromide reacts with Na metal. Hence, compound (a) must be isobutyl bromide.

Thus, compound (d) is 2, 5-dimethylhexane.

It is given that compound (a) reacts with alcoholic KOH to give compound (b). Hence, compound (b) is 2-methylpropene.

$$\begin{array}{c|c} CH_3-CH-CH_2-Br & \frac{KOH(alc)/\Delta}{(Dehydrohalogenation)} \blacktriangleright CH_3-C=CH_2+HBr\\ CH_3 & CH_3 & CH_3 \\ & CH_3 & CH_3 \\ & & CH_3 & CH_3 \\ & & & CH_3 \\$$

Also, compound (b) reacts with HBr to give compound (c) which is an isomer of (a). Hence, compound (c) is 2-bromo-2-methylpropane.

$$CH_{3} - CH = CH_{2} \xrightarrow{HBr} CH_{3} - CH - CH_{3}$$

$$CH_{3} - CH_{3} = CH_{3} - CH - CH_{3}$$

$$CH_{3} - CH_{3} = CH_{3} - CH_{3}$$

$$CH_{3} - CH_{3} = CH_{3} - CH_{3} = CH_{3}$$

$$CH_{3} - CH_{3} = CH_{3} =$$

## 23. What happens when

- (i) n-butyl chloride is treated with alcoholic KOH,
- (ii) bromobenzene is treated with Mg in the presence of dry ether,
- (iii) chlorobenzene is subjected to hydrolysis,
- (iv) ethyl chloride is treated with aqueous KOH,
- (v) methyl bromide is treated with sodium in the presence of dry ether,
- (vi) methyl chloride is treated with KCN.
- **Ans. (i)** When n butyl chloride is treated with alcoholic KOH, the formation of but l ene takes place. This reaction is a dehydrohalogenation reaction.

$$CH_3 - CH_2 - CH_2 - CH_2 - CI \xrightarrow{\text{KOH(alc)} / \Delta}$$

$$n - \text{Butyl chloride}$$

$$CH_3 - CH_2 - CH = CH_2 + KCI + H_2O$$

$$\text{But-I-ene}$$

(ii) When bromobenzene is treated with Mg in the presence of dry ether, phenylmagnesium bromide is formed.

Bromobenzene

Phenylmagensium bromide

(iii) Chlorobenzene does not undergo hydrolysis under normal conditions. However, it

undergoes hydrolysis when heated in an aqueous sodium hydroxide solution at a temperature of 623 K and a pressure of 300 atm to form phenol.

**(iv)** When ethyl chloride is treated with aqueous KOH, it undergoes hydrolysis to form ethanol.

$$CH_3 - CH_2 - CI \xrightarrow{KOH_{(m_1)}} CH_3 - CH_2 - OH + KCI$$
  
Ethyl chloride Ethanol

**(v)** When methyl bromide is treated with sodium in the presence of dry ether, ethane is formed. This reaction is known as the Wurtz reaction.

$$2 \text{ CH}_3 - \text{Br} + 2 \text{ Na} \xrightarrow{\text{Dry ether}} \text{CH}_3 - \text{CH}_3 + 2 \text{NaBr}$$

Methyl bromide Ethane

(vi) When methyl chloride is treated with KCN, it undergoes a substitution reaction to give methyl cyanide.

$$CH_3 - Cl + KCN \xrightarrow{\text{Nucleophilic substitution}} CH_3 - CN + KCl$$
Methyl chloride Methyl cyanide
