

# CBSE Class 12 physics Important Questions Chapter 15 Polymers

### **5 Mark Questions**

#### 1.Explain the mechanism of polymerisation of ethene.

Ans.Polymerisation of ethene takes place by free radical mechanism. It follows a three step mechanism:-

#### **Step I**: chain initiating step formation of phenyl free radical.

Chain initiation steps

#### **Step II:**

Chain propagating step 
$$C_6H_5-CH_2-\overset{\bullet}{C}H_2+CH_2=CH_2-\cdots \longrightarrow C_6H_5-CH_2-CH_2-CH_2-\overset{\bullet}{C}H_2$$
 
$$\downarrow \qquad \qquad \downarrow \\ C_6H_5+CH_2-CH_2+\overset{\bullet}{C}H_2-\overset{\bullet}{C}H_2$$

#### **Step III: Chain termination step**

### 2.Differentiate between LDP and HDP.

Ans.

(LDP) Low Density Polythene	(HDP) High Density Polythene	
1. It is obtained by polymerisation of ethane	1. It is formed when polymerisation takes	
under pressure of 1000 to 2000 atm. &	place in a hydrocarbon solvent in	
temperature of 350K to 570K.	presence of a catalyst e.g. Ziegter-natta	
2. It is prepared in the presence of dioxygen or	catalyst at 333K-343K and 6-7atm	
a peroxide initiator.	pressure.	
3. It has highly branched structure.	2. It requires Ziegler – Natta catalyst.	
4. It is chemically inert, tough and flexible.	3. It has a linear structure.	
5. It is a poor conductor of electricity.	4. It in more tougher and harder.	
6. It is used in toys, flexible pipes etc.	5. It is used for making buckets, dustbins,	
	pipes etc.	

# 3. What are Bakelite and Melamine? Give their structures.

Ans.Bakelite – It is phenol – formaldehyde polymer.

Melamine – It is melamine – formaldehyde polymer

### 4. Give monomers and preparation of Nylon - 6, 6 and Dacron.

Ans. Preparation

(i) Nylon - 6, 6

Monomers: Hexamethylene diamine Adipic acid.

$$n \frac{\text{HOOC(CH}_2)_4\text{COOH} + n \text{ H}_2\text{N} \text{ (CH}_2)_6 \text{ NH}_2}{\text{High pressure}} \xrightarrow{553\text{K}} \begin{bmatrix} H & H & O & O \\ N - (\text{CH}_2)_6 - N - C(\text{CH}_2)_4 - C \end{bmatrix}_n$$
Nylon 6,6

(ii) Dacron

Monomers: Ethylene Glycol

Terephthalic acid

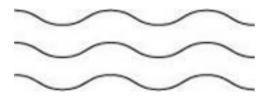

### 5. How are polymers classified on the basis of structure?

**Ans.**Polymers are classified on the basis of structure as follows:

### 1. Linear polymers:

These polymers are formed of long straight chains. They can be depicted as:

For e.g., high density polythene (HDP), polyvinyl chloride, etc.

### 2. Branched chain polymers:

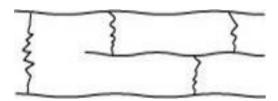

These polymers are basically linear chain polymers with some branches. These polymers are represented as:

For e.g., low density polythene (LDP), amylopectin, etc.

### 3. Cross-linked or Network polymers:

These polymers have many cross-linking bonds that give rise to a network-like structure. These polymers contain bi-functional and tri-functional monomers and strong covalent bonds between various linear polymer chains. Examples of such polymers include bakelite and melmac.

6. Distinguish between the terms homopolymer and copolymer and give an example of each.

Ans.

Homopolymer	Copolymer
The polymers that are formed by the polymerization of a single monomer are known as homopolymers. In other words, the repeating units of homopolymers are derived only from one monomer. For	The polymers whose repeating units are derived from two types of monomers are known as copolymers. For example, Buna - S is a copolymer of 1, 3-butadiene and styrene.
example, polythene is a homopolymer of ethene.	

#### 7. How can you differentiate between addition and condensation polymerisation?

**Ans.**Addition polymerization is the process of repeated addition of monomers, possessing double or triple bonds to form polymers. For example, polythene is formed by addition polymerization of ethene.

$$n \text{ CH}_2 = \text{CH}_2 \longrightarrow + \text{ CH}_2 - \text{CH}_2 \xrightarrow{}_n$$
Ethene Polyethene

Condensation polymerization is the process of formation of polymers by repeated condensation reactions between two different bi-functional or tri-functional monomers. A small molecule such as water or hydrochloric acid is eliminated in each condensation. For example, nylon 6, 6 is formed by condensation polymerization of hexamethylenediamine and adipic acid.

$$n \text{ H}_2\text{N}(\text{CH}_2)_6\text{NH}_2 + n \text{ HOOC}(\text{CH}_2)_4\text{COOH}$$
Hexamethylene diamine Adipic acid

 $+\text{NH}(\text{CH}_2)_6\text{NHCO}(\text{CH}_2)_4\text{CO} + n \text{ H}_2\text{O}$ 

Nylon 6, 6

### 8. Explain the term copolymerisation and give two examples.

**Ans.**The process of forming polymers from two or more different monomeric units is called copolymerization. Multiple units of each monomer are present in a copolymer. The process of forming polymer Buna-S from 1, 3-butadiene and styrene is an example of copolymerization

$$n \text{ CH}_2 = \text{CH} - \text{CH} = \text{CH}_2 + n \text{ C}_6 \text{H}_5 \text{CH} = \text{CH}_2$$

1,3-butadiene Styrene

Copolymerization

 $+ \text{ CH}_2 - \text{CH} = \text{CH} - \text{CH}_2 - \text{CH} \rightarrow_n$ 

Buna-S  $\text{C}_6 \text{H}_5$ 

Nylon 6, 6 is also a copolymer formed by hexamethylenediamine and adipic acid.

$$n \text{ H}_2\text{N}(\text{CH}_2)_6\text{NH}_2 + n \text{ HOOC}(\text{CH}_2)_4\text{COOH}$$
Hexamethylenediamine Adipic acid

 $+\text{NH}(\text{CH}_2)_6\text{NHCO}(\text{CH}_2)_4\text{CO} + n \text{ H}_2\text{O}$ 

Nylon 6, 6

### 9. Discuss the main purpose of vulcanisation of rubber.

**Ans.**Natural rubber though useful has some problems associated with its use. These limitations are discussed below:

- **1.** Natural rubber is quite soft and sticky at room temperature. At elevated temperatures (> 335 K), it becomes even softer. At low temperatures (< 283 K), it becomes brittle. Thus, to maintain its elasticity, natural rubber is generally used in the temperature range of 283 K-335 K.
- **2.** It has the capacity to absorb large amounts of water.
- **3.** It has low tensile strength and low resistance to abrasion.
- **4.** It is soluble in non-polar solvents.
- **5.** It is easily attacked by oxidizing agents.

Vulcanization of natural rubber is done to improve upon all these properties. In this process, a mixture of raw rubber with sulphur and appropriate additive is heated at a temperature range between 373 K and 415 K.

### 10. Write the names and structures of the monomers of the following polymers:

### (i) Buna-S (ii) Buna-N

### (iii) Dacron (iv) Neoprene

### Ans.

Po	lymer	Monomer	Structure of monomer
i	Buna-S	1, 3-butadiene	$CH_2 = CH - CH - CH_2$
		Styrene	$C_6H_5CH = CH_2$
ii	Buna-N	1, 3-butadiene	$CH_2 = CH - CH - CH_2$
		Acrylonitrile	$CH_2 = CH - CN$
iii	Neoprene	Chloroprene	$CH_2 = C - CH = CH_2$
iv	Dacron	Ethylene glycol	$HOH_2C-CH_2OH$
		Terephthalic acid	соон—Соон

## 11. Identify the monomer in the following polymeric structures.

(i)

(ii)

Ans.(i) The monomers of the given polymeric structure are decanoic acid

$$\left[HOOC - \left(CH_2\right)_8 - COOH\right] \text{ and hexamethylene diamine } \left[H_2N\left(CH_2\right)_6NH_2\right].$$

(ii) The monomers of the given polymeric structure are

$$H_2N$$
  $NH_2$  and HCHO  $NH_2$ 

### 12. How is dacron obtained from ethylee glycol and terephthalic acid?

**Ans.**The condensation polymerisation of ethylene glycol and terephthalic acid leads to the formation of dacron.

$$n$$
HOH<sub>2</sub>C — CH<sub>2</sub>OH +  $n$ HOOC — COOH

Ethylene glycol Terephthalic acid
